

# EZ TV IPTV STB Module

With the EZ TV STB Module installed on the EZ TV Portal server, every Set Top Box around the organization receives the full channel list as defined by the EZ TV Portal administrator. Users are able to control each of the STBs using its own remote control and have access to a graphical interface that includes the ability to browse through a list of all available channels, select channels from that list or using the channel up and channel down buttons, set the volume and viewing an information bar with channel information. Each TV screen in the organization can display any of the available channels, including the ability for several screens in different locations to display the same stream without loss of quality.
